PRETEND DRAWING LENGTHS · CENTIMETERS

Line	A	B
Length (cm)	24	9

These are invented drawing lengths. Do not measure the painting or real piano strings.

A comparison model, not two measured piano strings.
Compare length while imagining the material, thickness, and tension stay the same.

1. Line A is 24 cm long. Line B is 9 cm long. How much longer is A?

$$24 - 9 = \underline{\quad}$$

Draw or write your thinking.

2. Imagine drawing A and B end to end. What is their total length?

$$24 + 9 = \underline{\quad}$$

Draw or write your thinking.

3. Little erases 6 cm from line A. How long is that line now?

$$24 - 6 = \underline{\quad}$$

Draw or write your thinking.

Sketch two bars that start at the same place. Show which part is the extra 15 cm. A sketch need not be actual size.

GROWN-UP NOTE About 15 min: 3 to read the table, 9 to sketch or calculate, 3 to explain. A centimeter is a unit of length; cm is its short name. Use number-line hops or bar sketches, and accept a spoken strategy. The table supplies all numbers. These lengths do not predict exact piano notes. No instrument or measuring tools are needed.
