WONDER DAILY

Electrons

Too small to see

Little Wonderer studied an atom model under the lamp. An atom is a tiny building block of matter.

A few electrons move

Big rubbed a balloon on a wool sweater, then held it near paper bits. A few bits lifted.

Pull or push

"Charge can be positive or negative," said Big. Opposite charges pull toward each other. Like charges push apart.

A path through a wire

Next, Big closed a switch on a battery kit. The lamp lit. A wire is a thin metal path. Some electrons in metal can move along it.

A sock that stays

A sock stayed on a shirt when Little lifted it. "Static cling!" said Big. That means fabrics stick because of electric charge.

Where did they go?

Little drew the sock and shirt, with an arrow for electrons moving between them. "The tiny bits were already there," Little said.

Make a little book

1 Fold it into 8 boxes. Open it flat.

2 Fold short end to short end. Cut the thick line. Open it.

3 Fold the long way, pictures out. Push the ends in.

4 Fold into a book. Page 1 goes on the front!
