

A gray tip rested on a cloth. "Could that little piece do a big job?" asked Little Wonderer. "It is tungsten carbide," said Big. "A material is what something is made of. This one is heavy for its size and very hard. But being hard does not mean it can never break."

Little found another clue in a pen. Many ballpoint pens have a tiny tungsten-carbide ball that rolls ink onto paper. People make carbide by joining tungsten, a metal, with carbon. They press the powder and heat it very hot. A little cobalt metal usually holds the grains together, like glue.

Big set soap and a wooden craft stick on a tray. Little guessed what would happen, then watched. Big gently drew the stick across the soap. A scratch appeared: a small line dug into the surface. Hard means resisting scratches and dents. The soap gave way to the harder stick.

Does every material bend before it breaks? Big gently bent chalk over the tray. It snapped: chalk is brittle. A rubber eraser bent and came back: it is tough. Tough means resisting cracks and breaks from bumps or bends. Tungsten carbide is very hard, but brittle, so a strong knock can chip it.

WONDER DAILY

Tungsten Carbide

A little book of very hard things

Very hard. Not always tough.

GRADE 3

Make a little book.

1. Print one-sided: US Letter, portrait, actual size / 100%. No fit. Headers/footers off.
2. Fold long edge to long edge, reopen. Fold short edge to short edge, then in half again. Open: eight boxes.
3. Cut only the solid center line across the middle two boxes. Keep the outer boxes joined.
4. Refold long edge to long edge, print outside. Push ends together to open a diamond, then a cross.
5. Wrap into a book with page 1 in front. Follow pages 1 to 8.

Predict, watch a grown-up test, and pause whenever you like.

Your turn

Write one command for the soap test.

Example: Ask Big to hold the soap and gently drag the craft stick across it.

On a snowy walk, Little noticed the tips of their hiking poles. The tip is the small end that meets the ground. Some pole tips and ice-grip studs use carbide to bite into ice. "The hard part is only a tiny piece!" Little said. "Just where it is useful," said Big.
