A pretend job list to count

From marks to a morning. · Curiosity day

Name _____ Date _____

An imagined window. The picture is enlarged to help us see.

PRETEND NOTEBOOK · HEIGHT ABOVE SOIL

Day	1	2	3
Height	12 cm	19 cm	31 cm

Use the pretend notebook numbers. The picture is not a ruler.

1. Job counts grow across three pretend mornings: 12, then 19, then 31. Find the change from morning 1 to 2 and from morning 2 to 3. Which change is greater, and by how much?

19 − 12 = ___; 31 − 19 = ___; ___ − ___ = _____

Show your thinking.

2. One sequence uses 14 picture jobs and 9 word jobs. After that, 6 check jobs still wait. How many jobs are done before the checks? How many jobs in all?

14 + 9 = ___; ___ + 6 = _____

Show your thinking.

3. Someone says the total change from morning 1 to morning 3 is 18. Use the table to decide whether the claim is true and correct it.

31 − 12 = _____

Show your thinking.

Would every real lesson need exactly these job counts? No. These numbers are invented for our math story.

Quiet marks

Little Wonderer leans toward a soft screen. The marks are neat, not scribbles. "Are they a secret?" Big Wonderer waits.

Jobs in order

On the notebook, three jobs sit in a line: first, next, then last. That careful order is a sequence.

Each job runs

A quiet helper follows job one, then job two, then job three. A line lands. A wash of color follows. A word settles into place.

A page appears

Left: a blank page. Right: a picture and a short sentence. That difference is evidence the jobs worked.

Marks mean a lesson

Little returns to the first screen of marks. Beside it rests a finished morning sheet — a lesson ready to use.

Keep one question

The lesson is here: words, a picture, a puzzle to try. Code became a daily morning.

Make a little book

1 Fold it into 8 boxes. Open it flat.

2 Fold short end to short end. Cut the thick line. Open it.

3 Fold the long way, pictures out. Push the ends in.

4 Fold into a book. Page 1 goes on the front!

WONDER DAILY

From marks to a morning.

Explain a tiny transform.

From marks to a morning. · Curiosity day

Name _____ Date _____

Choose a scene. Write two linked sentences: one observation, then an explanation using because. Draw a detail that supports your idea.

Jobs in order

Each job runs

A page appears

Draw the detail you noticed. Add an arrow to show order or a path from job to page.

instructions · sequence · transform · evidence · inference · order · because

The order matters because … What changes if two jobs switch places?

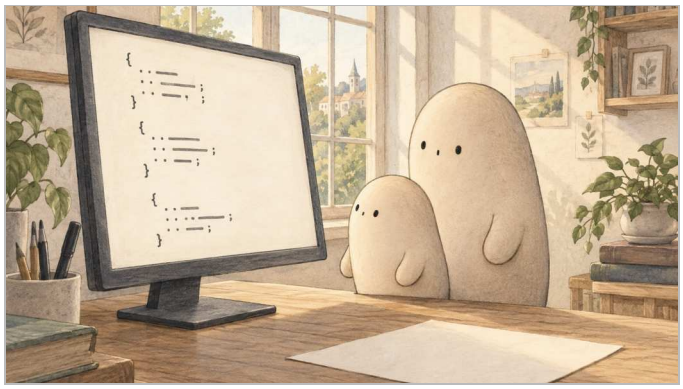

The page begins to change because … Which job left the first mark you can see?

I infer that the jobs worked because … Compare the blank page with the finished page.

Reread your words. Does the detail support your explanation? Check the first capital and each ending mark.

From marks to a morning.

01 What could these quiet marks be for?

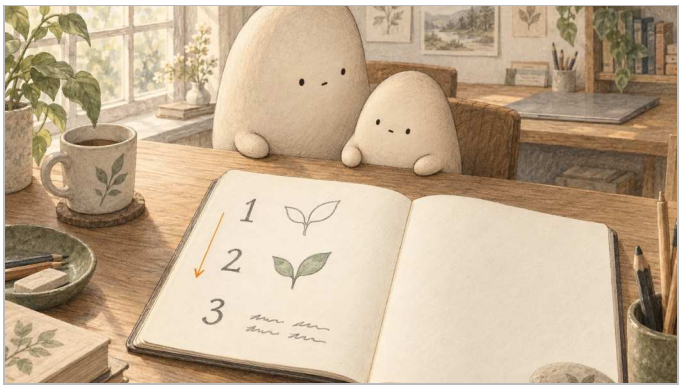

An imagined window. The picture is enlarged to help us see.

Look closer. Look at the screen. Are the marks scattered, or lined up? Find where Little's eyes rest first.

A little explanation. The marks look like a secret language. They are instructions — tiny written jobs a machine can follow. Alone, one mark does almost nothing. Together in a list, they can build something new.

Try this. Point to one mark, then the next. What changes if you skip one in the middle?

02 Why does the order of the jobs matter?

An imagined window. The picture is enlarged to help us see.

Look closer. Find the numbered steps on the notebook. Which job comes first? Which comes last?

A little explanation. A sequence is a careful order. Job 1 must finish before job 2 begins. If you draw the picture after you place the words, the page looks different than if you reverse those jobs. Order is part of the plan.

Try this. Say three morning jobs out of order. What goes wrong? Put them back in a sequence that works.

03 What happens when each job is followed?

An imagined window. The picture is enlarged to help us see.

Look closer. Watch the path from the list to the blank page. Where does a new shape first appear?

A little explanation. A helper — here, a quiet computer — follows each instruction exactly. One job places a line. The next adds a color wash. The next lays down a word. The page transforms: it changes from blank to pictured.

Try this. Trace the orange path from one job to the page. Which job left the first mark you can see?

04 How do we know the jobs worked?

An imagined window. The picture is enlarged to help us see.

Look closer. Compare the blank page on the left with the finished page on the right. What new evidence appears?

A little explanation. Evidence is a clue you can point to. The blank page had no picture and no sentence. The finished page shows both. That difference is evidence the instructions ran. We infer — we build an idea — that the ordered jobs made the change.

Try this. Name two details that were missing before and are present now. Why are two details stronger than one?
